

Most abandoned projects were never bad ideas.

MISSION

Help builders choose an intentional first version before spending weeks, or asking AI to build the wrong thing.

WHY WE EXIST

They were unscoped ones. Someone had a real problem in view, opened an editor, and started with the parts that were easy to start with: the login screen, the settings page, the framework decision. Months later the repo has everything except an answer to who it is for.

Generation got cheap. That did not make building easier, it made the wrong build faster. You can now produce a plausible application in a weekend without ever deciding what the application is for, and the tooling will cheerfully help you do it. The bottleneck moved from typing to thinking, and almost nothing moved with it.

Maker Compass is the step people skip. Not a finished product. A direction you can defend, before you spend your life on the wrong one.

VALUES

- 01 Direction over momentum

Random features create motion, not progress.
- 02 Judgment over generation

Generation is cheap now. Deciding what to generate is not.
- 03 Respect the idea

A messy idea is meaningful. It belongs to someone's life.
- 04 Show the work

Name the actual output and the next decision. Never sell a feeling.
- 05 Earn the restraint

Every word and pixel justifies itself, including ours.

MESSAGING PILLARS

The start is the hard part.
Builders need a bridge from idea to a clear first build. That gap is the product.

Faster is not always clearer.
Generation should follow product judgment, never replace it.

The first version should be intentional.
The smallest serious proof that the idea deserves more time.

Direction beats momentum theater.
Random features create motion. Motion is not progress.
